SimbirSoft, LLC

Senior QA Engineer / Fullstack QA Engineer

Worked in large fintech teams on Web, Android, API/backend, and integration scenarios, with a primary focus on Android and test automation.

Key Achievements:

- Performed a large-scale refactoring of 1,200+ Android automated tests as part of several test infrastructure changes, including SDK migrations, test data generation, user balance preparation, and migration to Deep Links.
- Reduced the full Android regression test execution time by 60–70%, from 3–4 hours to 50–90 minutes, by optimizing UI scenarios and using Deep Links, Intent interception, and controlled test states.
- Increased Web regression automation coverage from 80% to 95% within 2–3 months by expanding automation of key user scenarios.
- Joined a new fintech project as a temporary replacement and independently maintained the QA process within the first month without increasing testing timelines or delaying releases.
- Regularly conducted technical interviews for QA candidates, assessing their knowledge of Web, Mobile, API testing, and core QA fundamentals.
- Reduced the time required for typical bulk changes in test code by approximately 75%, from 2 hours to 30 minutes, using AI agents and reusable instructions for codebase analysis and modification.

Key Responsibilities:

- Functional, regression, integration, and acceptance testing of Web and mobile applications, with a primary focus on Android and additional experience in iOS testing.
- Testing REST/SOAP APIs, backend services, and inter-service integrations; validating data using SQL and messages in Kafka.
- Developing and maintaining backend and Android automated tests in Kotlin using an internal test framework and Custom DSL.
- Developing test automation components, Custom DSL, and reusable tools for test preparation and execution.
- Testing mobile scenarios across Android/iOS versions, SDK versions, runtime permissions, device-specific behavior, and interactions with system components.
- Building device matrices for Android and iOS regression testing based on OS versions, manufacturers, and platform-specific characteristics.
- Mobile Release Testing: validating release builds, application installation and updates, as well as distribution scenarios through Google Play, App Store, and TestFlight.
- Testing Android release builds with consideration for debug/release configurations,

minSdk/targetSdk, SDK compatibility, and R8/ProGuard obfuscation.

- Using Android Studio and adb to reproduce and localize Android defects; additional experience with Xcode for iOS testing.
- Analyzing automated test failures, maintaining and refactoring test code, and updating test stubs in Java.
- Analyzing logs and localizing defects across mobile/web clients, APIs, backend services, and integrations using Kibana.
- Working with Jenkins, Kubernetes, and test environments.
- Using AI Agents / LLMs for codebase, log, and error analysis, bulk changes, and test code refactoring.
- Participated in test planning for major changes by identifying risk areas, defining the required regression scope, determining integration checks, and selecting scenarios suitable for automation.

Tech Stack:

Kotlin, Java, Espresso, Android, iOS, Android Studio, Xcode, adb, Gradle, Android SDK, Google Play, App Store, TestFlight, R8/ProGuard, Deep Links, Intent, SQL, REST API, SOAP, Kafka, Jenkins, Kubernetes, Linux, Swagger, Kibana, Git, Charles Proxy, AI Agents / LLM, Custom DSL.

RITM

QA Engineer (Web / Mobile / API / Integration)

Key Achievements:

- Was the first QA engineer in a four-person product team and established the basic testing process from scratch.
- Built a regression suite of 100+ test cases from scratch, covering key user and integration scenarios.
- Introduced Confluence and Zephyr Scale for knowledge management and test documentation.
- Introduced Charles Proxy for client-server communication diagnostics and JMeter for performance testing.
- Established collaboration between QA and the support department and created an internal product knowledge base.
- Tested integrations with banking and security systems, including data exchange validation and error handling between external and internal components.
- Regularly conducted technical interviews for QA candidates and participated in assessing their technical proficiency.

Key Responsibilities:

- Functional, regression, and integration testing of Web, Android, and iOS applications.
- Testing REST APIs, client-server communication, and external integrations.
- Testing IoT systems and MQTT-based messaging.
- Testing a backend component responsible for processing TCP/IP messages, converting data to JSON, and subsequently sending events to Kafka.
- Working with PostgreSQL, MySQL, and Kafka to validate data and integration scenarios.
- Testing TLS and network communication between system components.
- Diagnosing network traffic and client-server issues using Charles Proxy and DevTools.
- Testing Android and iOS applications across different devices and OS versions.
- Selecting devices for regression testing based on platform, OS version, and device-specific characteristics.
- Using Xcode for iOS application testing and defect localization.
- Deploying and maintaining test environments using Docker and Jenkins.
- Web UI automation using Selenium.
- Performance testing using JMeter.

- Analyzing requirements and technical documentation.

Tech Stack:
Web, Android, iOS, Xcode, REST API, MQTT, TCP/IP, TLS, JSON, SQL, PostgreSQL, MySQL, Kafka, Docker, Jenkins, Selenium, JMeter, Charles Proxy, DevTools, Confluence, Zephyr Scale.

Additional Information

About Me

Senior QA Engineer / Fullstack QA Engineer with 6+ years of commercial experience.
My primary areas of expertise are Web, Android, API/backend, and integration testing, with 4+ years of experience in backend and Android test automation using Kotlin.
I work with systems end-to-end, including client applications, REST/SOAP APIs, backend services, databases, Kafka, logs, and CI/CD. My key strengths are technical localization of complex defects, regression optimization, and test automation development.
I also have additional experience in iOS testing, working with Xcode, mobile release testing, and building device matrices.
I have conducted technical interviews for QA candidates and participated in developing QA processes and planning testing for major changes.
I use AI Agents / LLMs for codebase, log, and error analysis, as well as test code refactoring and bulk modifications.
